SUMMARY

Final-year IT undergraduate targeting Software Development Engineer (SDE) roles, with experience designing scalable full-stack systems using React.js, Node.js, and database technologies. Proficient in building RESTful APIs, implementing secure authentication, and optimizing backend performance. Additionally experienced in developing and applying Machine Learning models for predictive analytics. Strong foundation in Data Structures and Algorithms with a focus on efficient, production-grade code.

EDUCATION

Manipal Institute of Technology

B.Tech in Information Technology; CGPA: 8.36

Bangalore, India

Aug. 2023 – May 2027

Bharatiya Vidya Bhavan's

High School (Class X); Percentage: 87.6%

Telangana, India

June 2019 – April 2021

EXPERIENCE

Frontend Intern

June 2025 – July 2025

Ada Insis

Hyderabad, India

- Developed real-world React.js applications including admin dashboards, interactive data tables, and dynamic user interfaces.
- Built a **Voter Management System** and **Electricity Bill Dashboard**, managing end-to-end planning through deployment.
- Utilized Git/GitHub for version control and performed API testing to enhance code stability in simulated production environments.

IoT Intern

May 2026 — June 2026

Vallynx Solutions Pvt Ltd

Remote

- Engineered a secure IoT communication layer using CoAP, DTLS-PSK, Eclipse Californium 3.x, and Scandium on AWS EC2, enabling encrypted machine-to-machine (M2M) communication with minimal protocol overhead for resource-constrained, low-power devices.
- Deployed and configured a production-grade CoAP server on AWS EC2 (Amazon Linux) with Elastic IP, Security Group rules, and background process management — providing globally accessible, cloud-hosted IoT endpoints.
- Documented the CoAP/DTLS communication workflow and AWS EC2 deployment architecture, creating technical handoff artifacts including user stories, acceptance criteria, and implementation notes.

PROJECTS

AI-Powered Facial Recognition Attendance System | *React, TensorFlow.js, face-api.js, Supabase*

- Developed a full-stack smart attendance and anti-spoofing portal utilizing React, Vite, Tailwind CSS, and face-api.js for real-time edge facial recognition.
- Engineered an anti-spoofing liveness verification engine incorporating landmark aspect ratio computations (EAR/MAR) and confidence boundary filters to detect and block static photo/screen presentation attacks.
- Architected a dual-storage data persistence layer via Supabase and a robust localStorage offline fallback.

Customer Churn Prediction Model | *Python, Scikit-Learn, Pandas, SMOTE*

- Built a supervised machine learning model (Random Forest) to predict customer churn, achieving an **F1-score of 0.85**.
- Addressed dataset class imbalance using SMOTE techniques, improving recall on the minority class by **15%**.
- Conducted feature importance analysis to identify key churn drivers, providing actionable insights for retention strategies.

TECHNICAL SKILLS

Languages: Java, C, Python, JavaScript, HTML/CSS, SQL

Frameworks: React.js, Node.js, NumPy, Pandas, Scikit-Learn, Streamlit

Tools: Git, GitHub, VS Code, Jupyter Notebook, Oracle, MySQL, MongoDB

Core Concepts: Data Structures and Algorithms, OOP, DBMS, Machine Learning, Deep Learning

CERTIFICATIONS & CO-CURRICULAR

Certifications: Python (Programming for Everybody), Machine Learning with Python, Generative AI Foundations.

Achievements: 24-hour ACM Hackathon Participant; Gold Medal in Intercollegiate Volleyball tournament.
